INTRODUCTION

Because of the rise of the Internet age, conventional business models underwent profound transformations. The traditional approaches to running a company have given way to more modern approaches that are more efficient. There have been recent developments in e-business models that take advantage of emerging technologies and concepts, and Google's business model is one such model.

The success of Google may be attributed to a unique method of doing business, namely one that makes the most of revenue from advertising. Google's business model is a complicated one. Their approach is founded on the pillars of sound decisions, an inventive workforce, the smart use of technology and marketing, superior products and services, and effective management.

Because of the utilization of this business strategy, Google has been able to rake in billions of dollars from advertising. The company uses a broad range of online tools, including search, YouTube, browser, maps, e-mail, financial, and social sites, in order to keep a strong online profile in the eyes of marketers and other users of the Internet.

A BRIEF HISTORY OF GOOGLE?

The origins of Google may be traced back to 1995, when Sergey Brin, then a student at Stanford, was credited with showing Larry Page around the campus so that Page could get acquainted with the resources available there. They had very little in common when their friendship first began. However, they were both perplexed as to how the first search engines managed to sift through the Internet's massive data trove.

After that, they started working on establishing a system in which the search results would be based on links to the websites on their own (how many other sites are linking to it). The new search engine that they developed was given the moniker BackRub, which comes from the processing architecture it uses. A short time later, the name was changed to "Google", a play on the word for "one followed by 100 zeroes", "googol".

When its founders successfully secured one million dollars in startup investment from friends, family, and other investors, Google Inc. was officially established as a separate company. Over the course of the following several years, Google saw fast expansion, opening a number of additional offices in Silicon Valley, California, which eventually became known as the "Googleplex".

The initial public offering (IPO) of Google in 2004 raised $1.66 billion, which turned seven individuals (including the two

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

founders) into billionaires and more than nine hundred additional people (including early shareholders) became multimillionaires.

At the end of 2011, Google was able to process three billion requests each and every day. The company found it essential to build eleven data centers, each of which could house hundreds of thousands of servers, in various locations all over the globe. Google now has 60,000 employees located in 50 different countries who collaborate to develop a variety of products that are used by billions of people on a daily basis.

WHO OWNS GOOGLE

Larry Page and Sergey Brin established Google, and they now serve as co-chief executive officers of Alphabet Inc., Google's parent company. Sundar Pichai was appointed CEO and Chairman in December 2019, succeeding the company's original founders.

GOOGLE'S MISSION STATEMENT

Google's mission statement is to "organize the world's information and make it universally accessible and useful".

WHAT IS THE GOOGLE BUSINESS MODEL?

Google uses a hidden pattern for its business model, which means that the consumer is not the one who is responsible for paying the cost.

Like most tech companies, it relies mostly on income from sponsored media. Businesses invest in search engine optimization (SEO) by purchasing ads that appear at the top of consumers' results pages. Due to Google's dominance in internet search — which accounts for more than 90% of all queries made annually —, this is a terrific bargain for marketers.

BUSINESS SEGMENTS OF GOOGLE BUSINESS MODEL

The business model of Google has been segmented into a number of subgroups, and each of these categories offers its own set of benefits.

Search Engine Segment
This is the most lucrative business segment that Google has, and it makes a substantial contribution to the company's overall performance in terms of revenues. This division encompasses a wide range of products, which include:

- Google Search
- Google Books
- Google Photos
- Special Searches

Advertising Segment
Google's advertising approach is critical to the company's financial success. For a predetermined fee, companies, marketers, and advertisers may have their advertising shown on Google. Products under this segment include:

- Google Ads, formerly known as Google AdWords
- Google Analytics
- Google AdSense
- Google Ad Mob

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Enterprise Product Segment
Products in this segment include:

- Google Search Appliance
- Google Apps

Productivity Tools Segment
Google also gives its users access to some of the most effective and useful productivity tools that are currently on the market. These tools include the following:

- Gmail
- Google Drive
- Google Doc
- Google Code
- Google Calendar

Additional Products

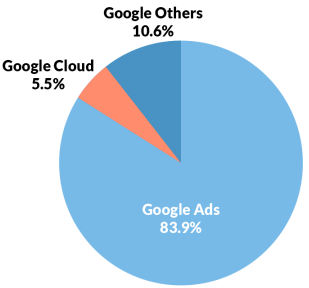

- Google News
- Google Phones and Android OS
- Google Fiber
- Google Lens
- Google Chrome

HOW DOES GOOGLE MAKE MONEY?

Since the company's start, Google has positioned itself as a tech company, and it has made substantial investments in a broad number of industries, including but not limited to internet search, mobile phones, artificial intelligence, self-driving cars, and health technology. But online advertising is Google's bread and butter.

REVENUE OF GOOGLE

ADVERTISING

Performance advertising is one type of advertising that Google uses. This implies that marketers are only required to pay out monies when their target audience really utilizes their intended call to action, such as clicking a link, for example. The cost-per-click (CPC) for a particular advertisement is determined by using its overall average for the time period

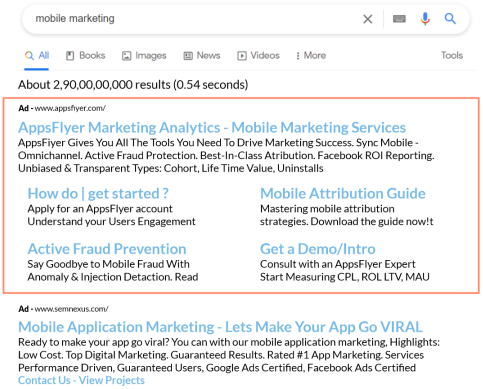

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

during which it was shown.

Brand advertising is another option. Advertisers pay a fee here depending on the number of times their advertisements are seen (CPM). This strategy works very well for a firm that wants to increase its exposure to a far larger audience. Google advertises using a variety of mediums, including the following five:

Google Ads

This used to be called Google AdWords. A user's search will trigger the display of advertisements that are relevant to their query at the very top of the page before any organic search results appear. When one of their advertisements is clicked on, advertisers are required to pay a little fee to Google. The sum is determined by the CPC.

When Google originally began offering its services, the company would only display text-based search adverts. Search advertisements proved to be quite effective due to the fact that they could be adapted to the specific needs of each individual user. Google Ads continued to charge on a CPM (cost per thousand impressions) basis, despite the fact that many other ad service providers had abandoned this

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

pricing model.

An early competitor to Google called GoTo had a different business model in which advertisers were only charged when a user clicked on one of their advertisements (because an individual who interacts with an advertisement (by clicking on it) is more desirable than one who simply views it).

Rather than paying a fixed fee, businesses who want to advertise on GoTo were required to compete with one another in an auction for prime placement. The advertising approach used by Google was derived in part from that used by Goto; more specifically, the firm shifted to a pay-per-click and auction-based strategy, although with certain modifications.

The auction that took place in GoTo functioned in the same manner that regular auctions do. Eric Veach, a computer scientist who had a significant role in the development of Google's Ads auction process, had a different perspective on the matter. He didn't see why businesses had to pay the price they bid, especially considering the fact that the next winning bid might have provided a far lower price.

The traditional auction method was effective in fulfilling its aim for one-time-only commodity auctions; but, it was ineffective during recurring advertising auctions. It established a situation in which the motivation for advertisers to lower their bids was constantly there.

As a result, Eric devised a new system in which the top bidders would not be required to pay the whole amount that they had proposed. Instead, the person who placed the highest bid would only need to pay a few cents more than the one who came in second place. The winner wouldn't have to worry about shelling out money for pointless costs, which is another perk of the system.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

The auction system was enhanced even more by Google with the addition of additional features. The advertiser's submitted offer would no longer be the only element that will be taken into consideration when determining the successful bidder in the auction. In addition to their bid, the winning ad would be determined by the quality score, which would evaluate how well the advertisement matched the user's search criteria.

Click-through rates (the number of times an ad was clicked as a percentage of total impressions) were first used by Google as a basis for determining an ad's quality score. After some time, improvements were made to the quality score approach so that it now takes into account both the content of the landing page and the relevance of the advertisement to the term that is being searched for.

Google Shopping
When Google thinks that a person is searching with the intention of making a purchase, it will display Google Shopping Ads in response to that search. Google Shopping ads are helpful for narrowing down an advertiser's target consumer base because of their relatively simple ad format and clearly shown prices.

Google AdSense
This system allows websites that allow Google Ads (banners) to make use of the system in order to provide visitors with adverts that are relevant to the content of the page. Advertisers part with their money in return for prominent placement based on time, space, and the audience they are attempting to reach.

Google AdMob
AdMob, according to what is claimed on its website, simplifies the process of generating revenue by providing in-app

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

advertising, actionable information, and powerful tools that are user-friendly for growing your app business. That is to say, application developers have the potential to generate revenue from their products as a result of the inclusion of adverts provided by third-party businesses.

YouTube

Here, ads are shown before, during, or after a video plays on YouTube. Advertisers are willing to pay to have their adverts shown in these places so that their marketing may be viewed on content that is suitable to either their target demographic or their product.

What is Google Ad Bidding And How Does It Work?

Multiple advertisers may often bid against one another for the same term (search network and display network) or space (display network), and Google will hold an auction to decide which advertiser will win. When deciding the winner of the auction, both the cost-per-click (CPC) bid (that is, how much you are willing to pay for a click on the advertisement) and the quality score of the ad will be taken into consideration.

The sum of these two factors determines each advertiser's ad rank; the advertiser whose ad rank is higher than the others at the end of the auction is the winner.

Display Network Campaign

You can get your advertisements shown on Gmail, YouTube, and other websites and applications that depend on AdSense and AdMob for revenue by making use of a Google Display Network Campaign. Users may see advertisements that are more relevant to them depending on the keywords they search for, the actions they take, and their interests.

Search Network Campaign

Through the use of the Google Search Campaign, you will

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

have the option to insert adverts straight into Google's search results. When a person searches for the given phrase, these advertisements will be shown.

GOOGLE PIXEL

This is Google's own brand of smartphones. Despite the fact that it is growing, it does not yet make a significant contribution to the overall market or to Google's bottom line.

YOUTUBE PREMIUM

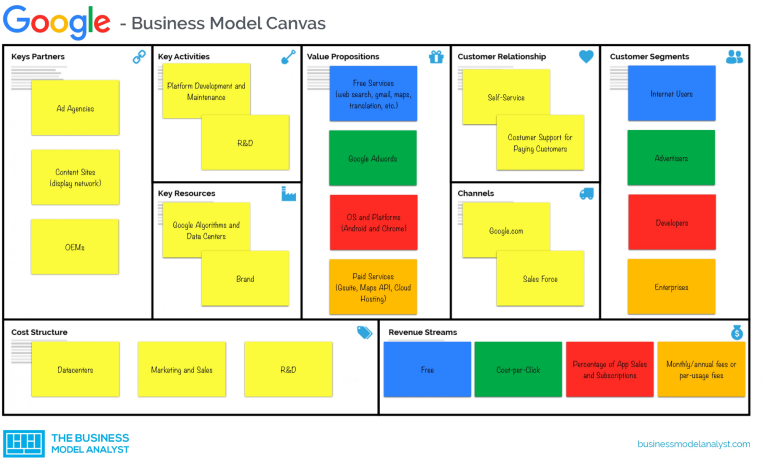

YouTube Premium is a paid service that removes ads from YouTube, YouTube Gaming, and YouTube Music.

GOOGLE CLOUD

It is a set of services that utilize Google's own servers and network for managing and executing applications in the cloud. These services are what make up the Google Cloud Platform (GCP). It is a subscription service in which companies pay only for the resources that they use on a continuous basis. It was responsible for 5.5% of Alphabet's total revenue in 2019.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

GOOGLE BUSINESS MODEL CANVAS

GOOGLE'S CUSTOMER SEGMENTS

Advertisers, publishers, and end-users make up Google's customers.

Advertisers

Advertisers may be any company or individual (an entrepreneur, for example), as long as they have a product or service that they want to market. On the list is BBDO, in addition to a number of other significant advertising powerhouses, as well as several smaller firms.

Examples include:

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

- Amazon, the biggest advertiser in the world, and it relies significantly on Google Ads;
- Large-scale advertising companies;
- Small and medium-sized businesses (SMBs);
- Various advertising, online, and marketing companies.
- SEO agencies.

Publishers
Since publishers provide valuable content, it is only logical for them to look for ways to make money off of their labor. AdSense is used as a method of monetization for websites by bloggers who have, throughout the course of their blogging careers, amassed significant amounts of organic website traffic. Google utilizes the banner real estate that they provide for the purpose of displaying tailored advertisements.

Among publishers are:

- Bloggers
- Online Media Outlets
- Magazine sites

Users
Users may refer to any of the many people who use Google to research a variety of topics, ranging from automobiles to health tips to vacation destinations.

The size of Google's user base is a critical factor in determining the company's success in luring advertisers. Because of this, Google has to continue investing money to enhance not just its search results, but also the overall quality of the user experience.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

GOOGLE'S VALUE PROPOSITIONS

The value propositions that Google offers will vary depending on the kind of consumer.

- The ability to direct advertising dollars toward highly specific demographic groups is one of the most valuable capabilities for advertisers. This is due to the fact that Google Ads are customized to each user's specific search keywords. Most times, individuals look for something that they can buy. Before making a significant purchase, at least 80% of today's consumers perform research on Google. Because of this, the efficacy of advertising is improved because it is directed toward consumers who are looking to make a purchase;
- A significant selling factor for publishers is the opportunity for them to profit from their works;
- The cost-free usage is the most significant advantage for users. Thanks to Google, they are able to do a search for anything, at any time, from any location, and have the results filtered and prioritized according to how helpful they are.

GOOGLE'S CHANNELS

There is no question that Google's principal methods of distribution include its own search engine as well as its other products such as Android, Chrome, Maps, and Gmail. In addition, across all of its products, Google makes extensive use of notifications and recommendations (Gmail, Play Music, Chrome, News, Play Store, etc.). Google's own products make use of Google's advertising ecosystem to cross-promote and

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

advertise among themselves.

These channels include:

- Google Workspace, former G Suite (including Gmail)
- Chrome
- Google Maps
- Google Analytics
- Google Ads
- Google Developer
- Google Cloud
- Android Devices
- Google Home

GOOGLE'S CUSTOMER RELATIONSHIPS

Using Google is effectively the same as eating at a restaurant that offers self-service. However, ensuring that search results are categorized appropriately for accuracy and relevance is an important component of preserving positive relationships with customers. People are able to acquire the information they want in a more expedient and safe manner as a result of this. This is also true for advertisements that are based on specific keywords.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

GOOGLE'S REVENUE STREAMS

Google's business model is based primarily on the generation of revenue from display network advertising, pay-per-click advertising, and CPM advertising.

Revenue From Other Sources

The search engine is now just one component of Google's broader business model, which incorporates a great deal more. Earnings from the company's many products and services, such as Google Cloud, Play Store, Workspace, Android, and Google Maps, as well as earnings from Google's various acquisitions, such as Dialogflow and Kaggle, have been incorporated into Google's business model over the course of the company's evolution.

Revenue from Google Maps

Google Maps depends on advertising revenue to finance its business activities (advertisements targeting local searches and promoted pins). However, the vast bulk of Google Maps' revenue comes from large companies' use of its application programming interface (API), which includes the likes of Trivago, Uber, Airbnb, and many more. The pricing of the program is a pay-as-you-go model, and developers also receive a monthly credit of $200 added to their billing account.

In addition, the business has established partnerships with other ride-sharing services, such as Lyft, which enables users of Google Maps to discover nearby taxis and get information about their rates.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Revenue From Google Translate

Similar to Google Maps, Google Translate is free for end users, but the company makes money off of the application programming interface (API) that other businesses utilize.

The application programming interface for cloud translation requires developers to just supply HTML pages in order to get back translated text. The application programming interface (API) provides support for over a hundred distinct languages, in addition to automatic language detection, and it is implemented using the Google REST API. Pricing is calculated monthly and is dependent on use.

Revenue from Google Workspace (former G Suite)

As part of Google Workspace — formerly known as G Suite — brand of cloud productivity and collaboration services, you get access to Google Gmail, Google Calendar, Google Drive, Google Chat (formerly known as Google Hangouts), Google Docs, Google Sheets, Google Slides, Google Sites, Jamboard, App Maker, and Vault. A freemium business model is used, which means that users are permitted to use part of the brand's cloud storage and other services without having to spend any money at all; nevertheless, customers will be required to pay for access to larger storage or for commercial usage of the service.

Other Google Cloud Products

Components of the Google Cloud include the Google Suite, as well as the Google Maps API, and the Google Translate API. Google, much like Amazon, provides a broad array of cloud-based solutions for programmers and bills them on a per-use basis.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Revenue from Android And Play Store

Even though Google's revenue may not increase as a direct result of Android's use, the company is able to avoid forking over millions or even billions of dollars to competing operating systems in exchange for continuing to use Google as their primary search engine and providing data that helps Google improve its advertising business model.

However, Google has made a very astute move by preloading all Android devices with freemium versions of Google Play applications. These apps provide access to a wide variety of various types of media and entertainment that can be purchased or subscribed to.

Revenue From Wear OS

For the smartwatches, Google has an operating system known as Wear OS, whose business model is similar to that of Android owing to the rich array of Google Apps that come preinstalled.

Revenue From Google Chrome

Google Chrome was developed so that the company would not have to continue paying browser developers to have Google set as the default search engine. If you use Google Chrome, you are giving your approval to have your online activity analyzed and used to customize ads and enhance the service.

Revenue From Devices (Made by Google)

It has been several years since the company made its debut on the market for a variety of physical assets. Google is responsible for the production and sale of a wide variety of products, some of which include Chromecast, Pixel,

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Chromebook, Pixel Slate, and Google Nest devices. The company has emerged as a powerful competitor to industry giants such as Amazon and Apple by capitalizing on its already-established brand reputation.

The Pixel brand was responsible for most of Google's revenues in 2018, contributing $1.78 billion to the company's total revenue of $2.98 billion, as reported by Android Authority.

Revenue From Google Domains

The option provided by Google for registering web addresses is known as the Google Domains service. It operates similarly to those of other domain registrars such as GoDaddy and Namecheap, amongst others.

GOOGLE'S KEY RESOURCES

The intellectual property and patents held by Google are the company's most valuable assets, rather than its physical infrastructure. In addition, they have things such as their search algorithms and Googlebot (the bot that indexes content), their worldwide technological infrastructure, their active users, their data assets such as user data and the Google Analytics tracking code, their advertising infrastructure, their technologies such as Android OS, their apps and digital assets, and their name.

GOOGLE'S KEY ACTIVITIES

Google's key activities have a goal of enhancing the user experience while mitigating the effects of negative network effects. The following gives a good description of such activities:

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Crawl and index
Google does a scan of the whole of the visible internet and then creates an index of its results based on the information that is present on each individual page;

Search, match, and present
Google sorts the results of each search according to the term, taking into account how relevant the sites that match a particular phrase are;

Improve searching
Because Google wants to make it easier for people to get the information they need, the company makes an attempt to predict what those users will seek next. Google believes that it has been able to enhance the quality of over 30% of its search results by automatically displaying the recent high-volume inquiries or by providing suggested queries. As a result of this, Google is continuously attempting to de-index websites that distribute clickbait, spam, and fake news.

Build ecosystems
This is what the company intends to do by fostering interoperability across all of its numerous products and services (such as Google Search, Chrome, Android, YouTube, and Gmail).

Marketing
Additionally, Google is responsible for promoting its many services and products.

GOOGLE'S KEY PARTNERS

Because Google's business model is based on a multi-sided platform, this suggests that all parties contribute in an equal manner to the overall success of the company. Consequently,

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

the company views its customers as its key partners because of this.

Users
Including those who use Google's services, such as Gmail, Android, Maps, etc., in addition to Google Search;

Content producers
The individuals who create the content that users will see in search results, including website owners, bloggers, influencers, and YouTube content creators, as well as those who also leave Google ad spaces on their own websites.

Advertisers
Businesses and companies who create their own websites, verify their existence via Google My Business, and advertise themselves via the many channels offered by Google. In addition to Alphabet, a wide variety of partners, including developers, shareholders, and manufacturers, as well as SEO partners, ensure Google's worldwide infrastructure.

GOOGLE'S COST STRUCTURE

In 2017, Google reported revenue of over $110 billion, and the company made a profit of $12.65 billion on that revenue. This shows a few key aspects of its financial reports, which are as follows:

Traffic Acquisition Costs (TAC)
TAC is an essential measure that may be used to gauge Google's potential for value generation over time. It is the

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

percentage of Google's total revenue that goes toward covering the expenses incurred in the process of gaining new customers. Additionally, this metric highlights the traffic that Google receives through its network members. Comparatively, the TAC rate on Google properties was 11.6%, but the TAC rate for network members at Google in 2017 was 71.9%.

Sales and marketing

During the same year, sales and marketing were responsible for 11.6% of total revenue, which was a little less than $13 billion.

Datacenters costs

In addition, Google invests a considerable amount of its revenue in the building and maintenance of data centers.

GOOGLE'S COMPETITORS

SEARCH ENGINES

Bing
The search engine by Microsoft now has between 2-6% of the overall market share. Despite this, it continues to be Google's only significant, big competition in this market. Bing places more importance on well-known and respected websites, in contrast to Google, which places a greater focus on fresh and engaging material.

Yahoo!
Yahoo's market share has fallen to less than 2% in recent years, despite the fact that it was previously one of the most popular available alternatives. It continues to function as a powerful gateway by providing material in a variety of categories, including entertainment;
DuckDuckGo
This search engine, which was launched in 2008, has branded itself as anti-google since it does not engage in user tracking. It only has a 0.3% portion of the global market, but it has expanded rapidly after it was shown that Google had significant privacy issues.

Baidu
This one company controls more than 60% of the market for search engines in China. Despite having just 0.8% of the market share worldwide, it is Google's greatest rival in China.

Yandex

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

This Russian search engine is quite similar to the popular Chinese search engine Baidu. Yandex controls up to 45% of the search engine market in Russia, while Google is restricted in some places because of the presence of content that is purportedly prohibited.

ADVERTISING

Facebook
The majority of the advertising on the internet is controlled by Facebook and Google. In the United States, the online advertising business is led by Google, which has more than 37% of the market share, while Facebook pulls in roughly 22%;

Amazon
On the surface, this competition might seem strange; however, when Amazon's overwhelming position in the product search area is taken into consideration, it makes perfect sense. As of current, the product search area that Amazon dominates accounts for 8.8% of the ad share.

VIDEO-SHARING (YOUTUBE'S COMPETITORS)

TikTok
TikTok, which has accumulated more than a billion subscribers in only six years, is currently among the hottest mobile apps, and it may be stealing away some of YouTube's viewership. TikTok, however, is generally geared toward short clips and snippets, in contrast to YouTube, which prioritizes long-form video content for the most part;

Instagram

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Due to the fact that users are able to upload videos to their feeds, IGTV, stories, as well as Reels, Instagram is in direct competition with YouTube in terms of the market for video-sharing sites.

MOBILE INDUSTRY

Apple
Android has swiftly overtaken iOS and now controls more than 75% of the global smartphone market. This is due to the fact that Apple's mobile operating system is only available on iPhones. Apple poses a danger not just to the software sector, but also to the hardware industry, especially now that Google has its own Pixel phone and has recently started delving into the hardware market.

CLOUD

Amazon Web Services
AWS dominates the industry by a significant margin, since it controls 33% of the cloud infrastructure used globally. Google ranks third with just 8%;

Microsoft Azure
With a stake of 16% in the industry, it currently occupies second place, behind only Amazon and surpassing Google in terms of the cloud market.

WHY GOOGLE'S BUSINESS MODEL WORKS?

SEARCH ENGINE

Advertising is the principal source of revenue for commercial search engines. According to Alexa, Google is the website that receives the most visits from users all around the globe, making it the most widely used search engine. This is more proof that the company has a significant role in influencing how consumers use search engines. For instance, instead of considering many different search engines, a significant number of Internet users now just say, "I'll Google it".

The innovative work done by Google's hardworking employees is a significant factor in the company's online business model, which has proven to be rather successful. To see this in action, all you need to do is consider the wide range of products and services that Google provides. The search engine used by the organization is not only user-friendly, but also fast to load thanks to its simplistic layout. This is a weakness in the early search engines that was ignored by the developers of such search engines.

Even though search engines have become more powerful, developers at companies like Yahoo! have designed search engines that are annoyingly slow for users by integrating a large number of links and banner advertisements. This causes the user experience to be excruciatingly slow.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Customers' opinions were taken into consideration and incorporated into Google's search engine. A great many of the early pioneers failed to take this into consideration while developing their models. Google developed a search engine that was not only fast and reliable, but also very simple to use. The company did not choose to implement a portal-style search engine like those that used to be dominant in the search engine market. Google "got it" and brought it to people.

ADVERTISING

There are a number of Google's online services that do not charge any fees of any kind to anybody who makes use of them. Despite this, the vast bulk of the company's revenue is generated by adverts that are directed at internet users. These advertisements were able to effectively reach individuals online with their message by using Google AdWords, which was a helpful tool. This innovative idea was conceived by Google as part of its drive to win over a greater number of internet marketers. The company used the cost-per-click approach in order to arrive at the appropriate amount to charge for advertising. This means that Google will not get paid by advertisers unless and until a user interacts with one of the advertiser's adverts.

According to experts, the approach that Google employs for its adverts on the internet is predicated on economic theories. This explains why Google has taken more than 60% of the market share for search engines. Additionally, Google uses auction theory as a tool for internal analysis. These ideas make use of a fundamental algorithm.

In addition, Google provides websites with the opportunity to participate in its AdSense program. You are able to utilize this medium to promote to people who are a part of the Google

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Network. Members get a varied amount of money on a regular basis in return for enabling Google's advertising banners to run on their own websites. Display advertising services built on the technology developed by DoubleClick are also offered. This kind of advertising service is characterized by its use of many forms of multimedia content, including video, images, text, and interactive features. These advertisements may be seen on the Google Finance page, as well as on YouTube and on the sites that are part of the Google Network.

TECHNOLOGY AND INNOVATION

The search technology used by Google is built on a complex network of algorithms. This is helpful for determining the PageRank of a website as well as for performing hypertext matching. Google calculates the search engine rating of a website based on "500 million parameters and 2 billion keywords," and the PageRank algorithm displays how important each page is in determining the website's overall ranking. In order to provide users with results that are relevant to their searches, Hypertext-Matching Analysis is used to examine websites as well as the content included inside them.

Weber believes that in order for Google to keep up scale, speed, and efficiency to serve its continually expanding number of users, the company has to invest in such algorithm technologies.

At launch, this advertising model that Google uses was very innovative. When the pay-per-click (PPC) model was first used, it fundamentally changed the way online marketing was conducted. Google took a risky and innovative method to do business online, and the results of this strategy have been very profitable for the company. Even in the present day, it is

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

responsible for a significant amount of Google's overall revenue.

By using a wide variety of innovative approaches, Google was able to create a number of notable web applications. The majority of the company's offerings are made available to clients at no additional cost. Some of the most useful applications now on the market include Google Maps, the Android operating system, Gmail, Google Scholar, and Google Earth, amongst others.

To a significant extent, technological progress can be credited for helping to bring about the creation of these innovative new products and services. The firm is a front-runner in the field of technology on a global scale. Because its search engine is superior to those of its competitors, Google has become the industry standard. Quick results to user questions indicate that vital information is easily accessible. The company's websites offer data rendered in a wide range of file types. This paves the way for people to access content on the Internet in a variety of formats, including text, photos, audio, video, etc.

Google is responsible for developing the mobile operating system Android. Android is a free software application that may be used on mobile devices. Smartphone manufacturers are able to download and install different versions of Android in their products, and software developers are able to build new applications for the Android operating system. Additionally, the company developed the Chrome OS. These apps are made accessible to end users and developers at no cost, and they are free to download, install, and update them as they see fit.

Google also works closely with a broad range of original equipment manufacturers (OEMs) in order to provide the Chrome OS to as many devices as possible. The firm has

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

developed a variety of software products for the OS that may be used for either business or personal purposes. The vast majority of these are different products developed by Google, such as Scholar, Docs, Sites, and Calendar. These applications are all available to users at no additional cost.

FOCUS ON COSTS AND R&D

Four primary tenets serve as the foundation for the company's expansion plans. Examples include research and development, sales and marketing, the acquisition of new customers, and data centers. Research and development consume a significant portion of Google's overall budget. However, as a result of this, the developers at the organization would be able to produce better products or make the ones they already have available easier to use. The daily number of inquiries handled by the company's millions of servers totals in the billions. Google has continued to invest in and maintain its data centers despite the substantial costs involved.

The firm is also responsible for bearing the expenses associated with compensating the member websites that serve as hosts for the AdSense advertising platform. These programs play a significant part in attracting a large number of consumers and ensuring that those customers will return for more. It is also crucial for the future success of the organization to have a sales and marketing staff that operates on a global scale.

Analysts forecast that Google's major source of revenue will grow in the coming years as the business continues to create and invest in new applications. The online business model that Google utilizes is effective because it makes use of these strategies.

BUSINESS MODEL OF DIFFERENT GOOGLE PRODUCTS

THE ADSENSE BUSINESS MODEL

What is Google AdSense?
With Google AdSense, you can put advertisements on your website and earn money whenever one of your visitors clicks on one of the adverts. The content of the page, which may contain keywords and other information, will be analyzed by the program, and the results of that analysis will determine which advertisements are shown.

When doing a search on Google, users are often presented with two to four sponsored advertisements. These advertisements are managed by Google Ads. The only difference between AdSense and search engine advertising is that it displays adverts on a user's preferred website rather than on the search engine's own pages. The majority of the time, they take the shape of texts, but they may also be presented as images.

Examples of AdSense Sites
The header, the sidebars, and the main content section of a publisher's website will often be populated with AdSense

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

adverts. One website that does this is Healthline.com, which provides health information and utilizes Google AdSense. Screenrant.com, one of the top websites for movie news on the internet, is another excellent example of a website that uses the AdSense advertising program.

How does Google AdSense work?
The following are the most vital steps to take after signing up for Google AdSense:

- Make some space available for advertising. You will need to make advertising space available on your website in order for Google to show adverts there. You can do this by inserting ad codes into certain places on your website;
- Set a time for the bids to be submitted. Advertisers will compete against one another in a real-time auction to get their ads shown on your website. Users that visit your website will be shown adverts from the businesses that submitted the highest bids;
- Receive your payment. Google will take care of all of the invoicing for you and will see to it that the advertisers pay you.

Advertisers may tailor their AdSense campaign in the following ways. Choose:

- The placement of the advertisements
- Page ad layout
- Ad types
- Ad size/format
- Ad groups to display or hide

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

In addition to its customizable settings, AdSense offers dedicated customer service, comprehensive reports on the performance of individual ads, and seamless integration with Google Ad Manager, and the website analytics tool, Google Analytics.

The Pros of the AdSense Business Model

- Relevant advertisements: AdSense will tailor its selection of advertisements to the particular subject matter or theme of your website. You are free to incorporate promotional elements that will attract and keep readers without having to limit the amount of space that is dedicated to the actual content that is being presented.

- It shouldn't be too difficult to have the advertisements on your website blend in with the color scheme, the borders, and the general style of the site. Instead of detracting from the overall look of your website, Google AdSense is intended to improve it.

- Advertisers pay varying amounts for ad space, but AdSense pays around $18 per 1,000 views on average. You are able to check both your click-through rate and profits in real-time by going into the private dashboard that AdSense provides.

The Cons of the AdSense Business Model

- AdSense's potential user base is restricted by the fact that it only supports fifty different languages;

- If your Google Ads account reaches a certain threshold and demands payment, Google will ask for evidence of your identification before making the payment. People who don't have a permanent residence, including digital nomads and frequent

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

flyers, run into difficulties in this scenario;

- If you utilize Google AdSense, which serves advertisements using JavaScript, the load times of your pages and the overall performance of your website may suffer as a result;

- In the event that Google discovers that clicks on a publisher's website are the result of fraudulent activity, the publisher runs the risk of being blacklisted. On the other hand, your click-through rate might be severely affected by automated software or by individuals who click on your adverts more than once.

In spite of these disadvantages, businesses that utilize AdSense and stay dedicated to their goal have a chance of seeing a big return on investment. If you can maintain your patience and perseverance, you will rapidly get these benefits.

How do you make money with the AdSense model?
When it comes to making money off of your website, the size and focus of your site are important factors. AdSense sites that concentrate on huge swaths of keyword categories are seldom successful. Advertisements are often charged on a cost-per-click (CPC) basis, with the CPC being subject to significant variation across several niches and keywords.

If the cost-per-click (CPC) for one of your keywords was $1, for example, then the advertiser would be billed $1 each time a user clicked on one of your advertisements, and your AdSense publisher site would earn a portion of the profit after giving Google a share of the income. CPM ads, often known as cost-per-thousand impressions, are still another choice (CPM). Determine which of these options will bring in the most revenue for your business.

Therefore, there are many different approaches that one may

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

use in order to achieve success with the AdSense model. You may look into the following, which are the three most significant:

- **Niche site:** Websites that cater to certain interests have less competition in search engine rankings;
- **Authority site:** When someone refers to a website as an "authority site", they are referring to a huge and well-established website that is the undisputed leader in its particular field and ranks first in search engines for competitive keywords. It is necessary to have a website that has hundreds or even thousands of pages and to continually add fresh content to it;
- **Multiple lower-earning sites:** Monetizing a lot of smaller websites using AdSense could make it easier for you to achieve your financial goals, while also reducing the amount of work involved.

Because the AdSense revenue model is a passive form of monetization, boosting a site's revenues mostly entails increasing the number of users who click on the advertisements hosted on the site. We take a look at the Click-Through Rate (also known as CTR), which is the ratio of total impressions to total clicks, in order to quantify this. Simply dividing the total number of clicks by the total number of impressions is all that is required to get the CTR. It is essential to get as many people to click on your links as possible. Despite this, you should resist the urge to click your own ads.

What AdSense Website Buyers Need to Know

A potential buyer of an AdSense website has to be aware, first and foremost, that websites of this kind are often relatively easy to keep up with and manage. This is the fastest and easiest method to establish a portfolio of sites that may make money for you if you are just starting out in the

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

internet world.

In addition, prospective buyers of such websites have to be aware of the significance of focusing on certain keywords in their marketing efforts. The highest-performing keywords in AdSense often have a CPC that is greater than average, although this is rarely the reality.

Higher competition for ad space at a better CPC usually means a higher ranking and more clicks for a given term. If you want people to find your website via Google's search results, you need to learn how to optimize it for search engines. Consequently, you'll need to be familiar with keyword research and search engine optimization.

Bear in mind that in contrast to many affiliate programs, you will need a considerably bigger number of visits in order to produce meaningful revenue from this one. You may be able to boost the number of visitors that might potentially turn into purchases as a result of Google AdSense retargeting. This feature allows you to show customized advertising to prior site users.

What Do AdSense Website Sellers Need to Know?

If you are considering selling your website, having one that is already making money via Google's AdSense program is great, since websites in this category often sell quite fast.

Because it is simple to use for first-time buyers, those who are just starting out in the realm of online businesses will seek it. Additionally, websites that are monetized by AdSense have the potential to create extraordinary sums of income on a monthly basis for the owners of the website.

When combined together, these two qualities guarantee that websites that generate revenue via AdSense also have the

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

largest buying audience of any websites that generate revenue through other models of monetization. It's similar to Amazon's affiliate program; however, websites powered by Google AdSense often have higher levels of success with sales.

The ease with which the move may be made is one further advantage of selling an AdSense website. Websites that use Google AdSense often need little more than an exchange of code between owners in order to start making money.

Before making a buying choice, the vast majority of prospective purchasers prefer to explore an AdSense website that has been generating revenue for at least one full year. Therefore, it is essential for sellers to bear this in mind if they are contemplating selling their Google AdSense websites.

This is due to the fact that almost all Google AdSense sites exclusively depend on organic search referrals to bring in new visitors. If your website has been consistently profitable for more than a year, it has most certainly gone through several different Google adjustments. This gives the consumer the peace of mind that they are not making a hasty investment in a website that will be rendered obsolete once Google makes a modification to one of its algorithms.

What Buyer Persona Best Fits the AdSense Business Model?

There is a certain sort of customer that is incredibly excited about each one of the many various ways that businesses might make money. The perfect match between acquirer and place may emerge for commercial reasons, or it may take place for reasons related to the buyer's personal lifestyle.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Lifestyle Larry

"Lifestyle Larry" enjoys the ease of maintaining websites that are monetized by Google AdSense. This is because he does not have to expend a lot of work on these websites. Even if he is absent from his website for an extended period of time — be it many days, weeks, or months —, he is certain that it will continue to be profitable.

Because search engine optimization (SEO) is the primary means by which AdSense websites gain traffic, "Lifestyle Larry" does not need to do much to ensure that the site will continue to earn cash.

A misunderstanding: the purchaser in question is not lazy. In general, all they want to do is kick back and have a good time. These are the types of investments that appeal to them greatly, since they increase their quality of life without also increasing the amount of labor they have to undertake.

Portfolio Paul

It makes a lot of sense for an online entrepreneur who currently has numerous websites live on the internet to purchase an existing AdSense website rather than starting from scratch. They take minimal work to operate, are straightforward to manage, and consistently provide a positive return on investment. The motivations for Portfolio Paul's acquisition of the domain are essentially the same as Lifestyle Larry's. In contrast to Larry, though, Paul is responsible for the management of dozens, if not hundreds, of websites that generate revenue.

Because of this, Google AdSense websites are a fantastic investment for him because they rapidly increase his portfolio without forcing him to put in a lot of effort or spend a lot of time on them.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

DIY Dave / Newbie Norm

AdSense offers "Newbie Norm" a useful model for the fundamentals of how online business functions. Acquiring an AdSense site is a move that makes great sense for a beginner like "DIY Dave". He might devote a significant amount of time and energy to the website in order to improve its search engine optimization and, as a consequence, its revenue.

Adding additional high-quality material to their sites is all Newbie Norms and DIY Dave need to improve their AdSense earnings.

AdSense Growth Strategies

Your AdSense website, like any other website, has room for improvement if you want to see an increase in income. Developing an AdSense website provides you with a multitude of transferable skills that can be used for many different methods of monetization.

Here are some of the most efficient ways to increase the amount of money you make with your AdSense website.

Creating More Content

Websites that make use of Google AdSense are often informative in nature. Your revenue from Google AdSense will go up if you add more material to your site. Think of your AdSense-supported website as if it were a magazine. The larger the amount and quality of information that you have on your website, the more people will come, read, and perhaps interact with the adverts that you have there.

Making this happen doesn't need you to be a writer, which is a huge relief. In fact, many marketers don't even write a single

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

word of their own content at all.

Sites such as iWriter, HireWriters, and Upwork, amongst others, link marketers with freelance writers who provide needed sets of abilities. You should make sure that your content has a significant focus on relevant keywords if you want to see an increase in traffic from organic search results.

Paid Traffic

Advertisements on Facebook and other forms of sponsored traffic may, despite the fact that they aren't often utilized by Google AdSense publishers, nonetheless be used to generate some revenue. If your website is social in nature, a sponsored social media ad might potentially become popular, which would result in a big rise in the number of visits.

Split Testing

When you have a sufficient number of visits to your website, you can start conducting experiments to determine the optimal placement of your advertisement blocks in order to achieve the maximum possible revenue. There is a possibility that the positioning and dimensions of the advertising blocks on your website will have a substantial effect on the amount of money brought in by those advertisements.

GOOGLE CHROME BUSINESS MODEL

The fact that Google does not offer financial statistics for all of its services makes it more difficult to get insight into the company's overall performance financially, particularly with regard to Google Chrome. Chrome, which is part of Google Services, does, however, primarily rely on income generated by advertisements in order to remain operational.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

It is fair to suppose that Google Chrome is lucrative, given that the company plans to continue investing resources into the product in the foreseeable future.

Chrome brings in cash for Google by reducing the number of royalties the company is required to pay for rival browsers' usage of Google's search engines.

Chrome generates revenue for Google in a variety of additional ways. Users of Google Chrome are more likely to also utilize other Google services due to the strong integration that exists across the company's many products (such as Gmail, Google Apps, Google Docs, etc.). Visits to the websites and revenue from advertisements both increase with each usage.

Google's AdSense platform is another method for generating revenue via Chrome. The AdSense service offered by Google is quite interested in gathering information about you. Chrome gathers information about its users in order to better customize the advertisements provided by AdSense.

GOOGLE MAPS BUSINESS MODEL

What Is Google Maps?

Google Maps is a location-based search engine that provides users with the ability to perform things such as pinpoint an exact place, create travel itineraries, identify areas of interest nearby, and even check out a street-level perspective of a location using Google Street View. It works with any computer or mobile device, regardless of whether it runs Android or iOS. In addition to this, it may be accessible via the built-in navigation systems of a variety of vehicles of different

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

makes and models.

The capability of Google Maps to return results for any search query and to provide a number of different transport modes for traveling to a destination is its most fundamental feature.

Google Maps will use the GPS capabilities of the device, if it has them, in order to determine the location of the user. It also incorporates the traffic data from Waze, which it bought in 2013, into its recommendations for routes to take. Google Maps assists users in getting where they need to go by providing them with turn-by-turn instructions and 2D and 3D satellite imagery of the location.

The major purpose of Google Maps is to provide assistance to users in navigating the areas in which they are located. In addition to this core function, Google Maps also encourages users to find and participate in local events, places, and activities. A significant part of this is played by the Explore tab, which draws attention to the highest-rated and most-visited locations in the region. Users are able to create their own lists and bookmark locations for later use.

The majority of the information used to formulate these recommendations comes from customer feedback in the form of star ratings ranging from one to five. If a user provides a written comment in addition to photographs, their evaluation will be given more consideration. Additionally, a company's profile on Google Maps may be updated by the company itself to add information such as the firm's physical location, contact information (such as a phone number), website link, social media accounts, and images of the business.

It is essential to keep in mind that not all businesses utilize Google Maps; nonetheless, it is possible that customers of businesses that do use Google Maps will be able to book reservations straight from the app. A barbershop, for

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

instance, may take appointments from customers. And since WhatsApp can be integrated with Google Maps, businesses may use the messaging tool to react to inquiries from potential customers.

Google Maps is used on a regular basis by well over a billion people across the world. Because of this, it has grown to become the most used navigation system in the world. In addition to this, it has information on approximately 200 million different businesses and places all around the world.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

What Google Maps Service Offers: Quick Overview

What can you use Google Maps for?

Explore the local area by looking up businesses and locations;

- The map may be used normally and can be explored using both the street view and the satellite view options;
- View of a street in a full 360 degrees (sometimes it's even possible to get inside buildings);
- When you use route planning and navigation services, the community-generated data on accidents, speed traps, and traffic slowdowns may help you arrive at your destination more quickly and safely;
- A very new innovation is navigation with augmented reality using live view;
- Through the use of the "Google My Business" tool, businesses have the ability to add their physical locations to Google Maps.

How Google Maps Works?

Due to the fact that it is used by more than 154 million people on a daily basis, the term "maps" may now be used interchangeably with Google Maps. It provides information on anything from the current state of traffic to route maps and businesses in the surrounding area. However, they can only provide such vast amounts of data via crowdsourcing.

Google Maps places a significant amount of reliance on the information provided by its Map Content Partners. We can divide Map Content Partners into five different categories altogether:

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Base Map Partners For Geological Maps

The Base Map Partner Program receives vector data from a variety of recognized organizations such as the United States Department of Agriculture Forest Service, the United States Department of the National Park Service, the Rails-to-Trails Conservancy, and the United States Geological Survey.

Imagery Partners For Aerial Views

The high-resolution aerial photography that is utilized in Google Maps and Google Earth comes from a variety of partners, including both private companies and public agencies. These photographs were taken from a very high altitude, either by a satellite or by an airplane.

Transit Partners

Transit is a tool for arranging public transportation that combines Google Maps with the most recent data made available by agencies. This data includes information on transit stops, routes, schedules, and rates. This category includes both public transportation services such as trains, buses, and subways as well as commercial transportation companies such as Uber.

Individual Partners

Through the collection and analysis of location data from your smartphone, Google is able to provide services such as real-time traffic updates, new routes, alternate routes, and so on. But that's not all; anybody who uses Google Maps has the opportunity to sign up to be a local guide and help the development of the service by providing their own insights and knowledge about their neighborhood.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Google My Business

If a firm signs up for Google My Business, it will be able to add itself to Google Maps and be found by potential customers. The usefulness of the service continues to grow with each passing day, thanks to the continuous and automatic addition of more addresses.

How Does Google Maps Make Money?

Advertising

The vast majority of revenue that Google Maps generates comes from the many types of advertising that are shown inside the app interface.

The sponsored search results on Google Maps are the company's major method of advertising. These kinds of advertisements show up whenever a user does a search inside the application, regardless of whether they are using a computer or a mobile device.

If a company is ready to shell out money for advertising, it will rise to the top of the list of search results for a specific query. Customers often only look at the first five search results, so having a high ranking in these areas might help your business get a greater number of visitors.

Local Search Ads

Local search adverts often appear in the top results when people do searches on Google or Google Maps, or just explore local businesses on Google Maps.

Promoted Pins

On Google Maps, a small icon resembling a "pin" is used to represent each location on the map. However, in cities with tens of thousands of businesses, it may be difficult to pinpoint an exact location due to the many dots. Google gets its foot

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

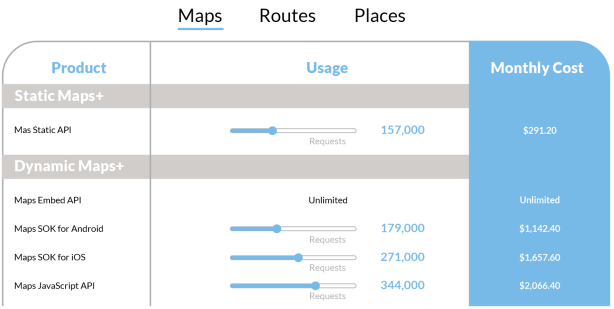

in the door by dangling the possibility of a company's logo being used to replace the standard pin. For example, McDonald's must pay a fee to the search engine in order for its well-known "M" logo to be displayed on all versions of Google Maps. Those logos have separate color schemes, which makes it simpler to distinguish them.

This increases the company's visibility, makes the experience of the consumer smoother, and, as a logical consequence, leads to an increase in sales. Because it is neither overbearing nor flashy, consumers are more likely to click on it simply out of familiarity with the brand.

Commercial API

Google also makes money from the use of its Maps API by other businesses.

When other businesses — such as Bloomberg and eBay — pay Google to utilize the company's mapping data inside their own products, Google is able to generate income from such activities. The amount of money that a customer will have to pay in order to utilize Google Maps is determined by the number of queries sent as well as the data type (Maps, Routes, or Places).

There is no question that it is a profitable venture for Google

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Maps as well. According to the prospectus for Uber's first public offering (IPO), the business paid Google Maps a staggering $58 million between January 2016 and December 2018 (which works out to over $53,000 per day). In spite of the fact that the two parties have already renegotiated their agreement, the fact that this illustrates the financial potential of the mapping data market is noteworthy.

Referral Fees

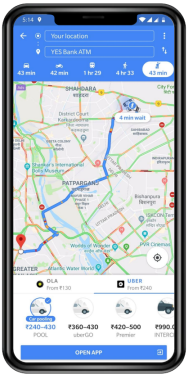

When a customer books a service via the platform, partners pay referral fees to Google Maps. This means that Google reaps additional financial advantages in addition to those derived from advertising income.

Through the use of the Google app, you are able to arrange appointments (for example, at salons). Nevertheless, in addition to these apparent uses, it may also be used for a broad variety of other purposes.

Due to the fact that its reliability has been steadily improving over time, people will soon come to rely on Google Maps exclusively. It has the potential to become a "super app", or a universal service that is able to respond to almost any kind of customer query. Both Meituan and WeChat, two digital behemoths based in China, are often regarded as the pioneers of this trend.

If smaller businesses and platforms like OpenTable want to maintain their position in the market and remain competitive, they will need to connect with Google Maps, which has the potential to become the de facto standard for local search.

How Much Money Google Maps Makes?

When the company was asked how much money Google generates with Google Maps, they remained silent about the topic. One of the few metrics that Google publicly shares is the number of users who are active at least once per month on Google, which is one billion. Due to this fact, Google Maps is currently the undisputed leader in the market, not only in the United States but also all over the world. Google Maps was being used by 154.4 million people in the United States as of April 2018, making it six times more popular than the next competition.

How much of a profit does Google earn off of its Maps product? According to the projections included in this infographic, Google Maps was expected to bring in an annual revenue of $4.3 billion in the year 2020. It comprises 3.5 billion dollars in advertising money and 0.8 billion dollars in revenue from the use of Google Maps' API.

ANDROID AND PLAY STORE BUSINESS MODEL

Android is a mobile operating system that has proven to be quite popular among smartphone users all over the globe. It competes closely with iOS in markets where English is the native language, and it mostly outperforms iOS in areas where English is not the primary language. Because Android

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

is free and open source, Google typically does not require businesses to pay a licensing fee in order to utilize the Android platform.

Where does Android's revenue come from?
The Play Store, offered by Google, is Android's principal source of revenue. It really shouldn't come as much of a surprise, given the sheer number of individuals who use the Play Store. In particular, it is a standard feature on all mobile devices that are powered by Android. With the noteworthy exception of China, where Google has yet to achieve widespread adoption (Android is widely used there though), Google has a significant presence in the majority of global economies. The company also receives a sizable cut of revenue from purchases made on the Play Store, which may reach as high as 30%.

When you buy an application or game from the Play Store, Google and the creator of the application or game split the revenue from the sale. As compensation for hosting the application and making it accessible to users, Google receives at least 15% of any revenue generated by the app. And although it might not appear to be much at first, it quickly adds up when you take into account the fact that there are more than a billion Android smartphones in circulation. In spite of this, the true profit is nowhere near 15-30% due to factors such as operational expenditures.

In addition to direct app sales, the company also generates income from in-app purchases and subscriptions to various tiers of content inside apps. Google receives remuneration from third-party services such as Netflix and Amazon Prime in order to process payments via the Play Store. Because so many free apps utilize Google services for in-app advertisements and analytics, even those apps themselves might be a source of indirect revenue.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Because of things like smaller displays and more accidental touches, Google could make less money from mobile advertisements than it does from desktop searches. However, due to the continued growth of mobile use, even a little profit per ad click might generate millions of dollars in revenue and a plethora of insightful data for the company.

How Android Makes Money Through Google Play

Comparing 2017 and 2018, Google Play's total revenue reached $24.8 billion, representing an increase of 5.3 billion USD. Without a shadow of a doubt, Google Play is one of the primary engines that powers Android's business model.

Google Play Books

Google Play Books is an online bookstore that provides users with access to millions of books, both paid and free, that may be read or listened to.

Google Play Games

This online gaming service offers additional features to supplement the games that can be found on the Google Play Store. These additional features include real-time multiplayer, leaderboards, cloud connection, and achievements. Android mobile devices all come with this feature as standard.

Google Play Store purchases and in-app payments

Virtually all of this platform's apps are developed independently by other parties. Some of them need payment, but the majority are totally cost-free.

Because Google is a profit-driven enterprise, it must charge app developers a fee for the privilege of using its Play Store to distribute and process payments for its products. The company deducts 30% of all revenue generated from app

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

purchases and app downloads. When customers sign up for subscription-based recurring billing, the business retains 30% of their money in the first year and 15% annually after that.

How Google's Android Makes Money through Mobile Search

The bulk of Google's revenue comes from advertisements shown on mobile devices. Advertising is the primary source of revenue for Google. If we follow this line of reasoning, it would seem that Google is benefiting the most financially from Android in the form of mobile search-related advertising and that if we were to discover Google's revenues from mobile search, we could easily calculate Android's earnings as well.

However, doing so would be unwise due to the fact that Google could still generate a significant amount of money from mobile search even in the absence of Android, and the decline in income from mobile advertising would not be disastrous. The relevance of Android is tied to something that is far more significant to Google than the money it makes from advertising.

The problem with trying to equate Google's mobile revenues with those of Android is that it is not just Android phones that enable Google to make money from search advertisements; Apple's iPhones do as well. It is a massive leap of logic to believe that the mobile advertising income produced by Android phones would suddenly cease to exist without Android.

It is reasonable to hypothesize that if Google did not own Android, the company would likely negotiate a profit-sharing agreement with other manufacturers that was similar to the one it has with Apple. At the moment, Google is required to pay Apple billions of dollars each year in order for Apple to continue using Google as the primary search engine.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Another reason to have faith that Google's dominance in the search market would not be much impacted in the absence of Android is the fact that Google is currently the best search engine available in regard to the quality of the results it delivers. Customers would prefer this alternative, nonetheless, due to the higher level of product quality. And if their consumers appreciate it, hardware companies are more inclined to support it if it's a good idea overall for the industry.

The popularity of Google Search is best seen by looking at how often it is used on desktop computers running Windows. Even though Google does not own Windows, it has long dominated Windows-based search engines, and this was true even before the Chrome web browser was made available.

In return for Google Search being solely preloaded on the devices that they manufacture, Google already provides other phone manufacturers, notably Samsung, with a portion of the advertising earnings that it generates. While Google is the owner of the operating system, the fact that it must share earnings with Samsung despite the fact that it is the owner of the platform makes it less competitive with Apple's iOS devices.

Pixel, Google’s own smartphone line, seems to be the only smartphone for which Google is completely certain that it will not be compelled to utilize profit-sharing. Nonetheless, Pixel does not yet have a particularly large portion of the market.

How Much Money Android Makes from Google Pay?

If Google did not have authority over Android, it is inconceivable that Google Pay or any other app like it would ever come into being. As a result, revenues from Google Pay can also be considered revenues from Android.

How much money would be lost by Google if there were no

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

such things as Google Pay? Due to the fact that Google Pay was not launched with a revenue-generating model, the correct answer for 2019 is $0. However, this might not be the case in the future, since Google Pay has the potential to bring in billions of dollars in revenue each year.

Though Google Pay may not yet be profitable, the company has already recorded revenue of 1,467.36 crores in India for 2020/2021.

How Licensing Fees Makes Money For Android

License fees are another way for Google to profit from Android. It's a new way to make money that didn't exist before 2018. However, it wasn't Google's idea to implement the change.

Because of its primary features, it was impossible to refer to Android before 2018 as an open-source platform. When reduced to its most elemental form, it may at most be thought of as a speculative potential for manufacturers. However, in the event that manufacturers satisfied Google's many criteria, even the proprietary Android version that included Google Play Store was made available at no additional cost.

In response to the record €4.3 billion fine imposed against Google by the European Union in 2018 for abusing the dominant market position of its Android platform to increase the reach of Google's search engine, Google has provided device manufacturers with the option to license Google Play and other apps without Chrome and Google Search. If they went that route, however, they'd have to fork up some licensing cash to Google.

The cost of the license could be tied to the retail price of the phone in question, and it might differ from one device to another in terms of the screen resolution of the display it has. According to some estimates, the cost may range anywhere

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

from $40 for the most costly phones to $10 for those with a display quality that is subpar. In some countries, the licensing price for a basic phone might drop as low as $2.5.

Other Ways How Google Makes Money or Benefit from Android

Android also offers Google a number of other benefits that it may take use of. On the other hand, the fact that some of them are difficult to quantify does not mean that Google does not place importance on them.

List of Other Benefits

- Android vastly improves Google's control over the smartphone market and its capacity to influence the products of its competitors, which in turn considerably reduces the company's exposure to financial loss.

  Without Android, Google's ability to bargain with device manufacturers to pre-install Google Search and other Google services would be considerably hampered. This would make it much more difficult for Google to sell its products. It is usually ideal to have full command of the "entry point", or point of access, through which users connect to the internet. Using the Chrome web browser on an Android smartphone makes this task far simpler.

- Google also receives significant data on user behavior from the Android platform. Even while it is possible to avoid signing in with a Google Account, doing so drastically limits the functionality of an Android phone, since Android phones need users to have an account in order to operate properly.

  As a result of this, the vast majority of people who use Android devices are logged into their Google

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

accounts. This provides the search giant with access to a lot of information about the users' routines and habits. By remaining signed in with an Android phone, Google is able to target advertisements without relying on cookies.

- Chrome, Photos, Duo, Drive, and YouTube are just a few of the free apps that Google promotes via Android.
- The fact that Google controls the Android platform and can, as a result, exert influence over its development goals and the market for in-app advertising is a tremendous boost to the bottom line of the corporation.

How much money does Google make from Android?
It is impossible to speculate on the amount of revenue that Google generates from Android sales. Companies that are publicly traded are required to provide their shareholders with an update on the company's financial status every three months. However, since Google operates in so many other areas, isolating Android's contribution to the company's bottom line is a challenge.

In the section of its annual report titled "Google Services", the company reveals the sum of its revenue, which comes from a variety of sources. These figures include not just the profits produced from Android and Chrome, but also those made through Maps and hardware. The firm made $6.8 billion in revenue during the first quarter of 2022 thanks to these "services".

Although the statistic that was just provided offers some insight into Android's financial health, it is by no means comprehensive. To set the record straight, every bit of this obscurity was done on purpose. Google's preference is to stay quiet about the amount of money it makes from Android

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

rather than provide this information to the general public.

In 2016, Google filed a motion with a court requesting that some records be redacted and kept secret in order to protect the revenue earned by its Android ecosystem. It was stated that Google does not explicitly apportion revenues or profits to Android differently and independently of Google's broader business.

At that time, the legal team at Oracle estimated that Android had generated $31 billion in sales and $22 billion in profit. However, considering that those assessments were reported more than five years ago, it is possible that a great deal has changed.

ORGANIZATIONAL STRUCTURE OF GOOGLE

To some extent, Google employs a flat matrix structure, which is a kind of cross-functional (team-based) organizational design. As a result of the company's expansion into a tech giant throughout the years, its organizational structure has evolved into one that is more centralized.

GOOGLE'S SWOT ANALYSIS

GOOGLE'S STRENGTHS

Leadership
Since there are no significant competitors to compete with it, Google has solidified its position as the premier web search engine.

Brand
According to Forbes, Google is the second most valuable company in the world, behind only Apple in terms of market value. Also, Google itself is a popular brand.

Technology
Over 40,000 queries can be answered by Google's system per second, which would equate to 3.5 billion every day.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Revenue
Google's enormous profits ensure it has one of the quickest growth rates in the world and allows the company to continually reinvest in research and development as well as to make strategic acquisitions.

GOOGLE'S WEAKNESSES

Privacy policies
Google's algorithms and internal practices are regularly the subjects of scrutiny.

Overdependence on advertising
This source of revenue accounts for more than 80% of overall sales, and it is susceptible to the negative impacts of over saturation in the market, the introduction of new technologies, and political and economic instability.

Boycotts
As a result of their adverts being placed next to content deemed to be extremist, a number of prominent companies have opted to avoid Google and YouTube.

GOOGLE'S OPPORTUNITIES

Wearable market
Google acquired Fitbit in 2019 in order to strengthen its position in the fast-growing markets for smartwatches and fitness bands.

Cloud services
While Google may be in third place in the cloud computing industry, and its services may not be as good as those offered by the market's top two competitors, the company is making

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

considerable investments in this sector in order to both improve the market and diversify its own sources of revenue.

Google Meet
As a result of the recent pandemic, there has been an increased demand for telecommuting services, which Google has taken advantage of.

Expansion
Cloud computing and high-speed internet are often met with a positive reception in economies that have just recently begun to experience growth. Providing opportunities for future expansion.

Revenue diversification
Google has non-advertising dependent products, so it doesn't have to rely on advert revenue. These products include Google Cloud, Google Play, YouTube TV, and hardware, among others.

GOOGLE'S THREATS

Market share
Google is watching as its share of the pie falls as a result of competition from companies such as Facebook and Amazon, which are becoming big competitors in the online advertising market.

Anti-encryption
Encryption technology is being targeted by governments and groups that safeguard children in an effort to get it outlawed so that online child molesters may be found and brought to justice more swiftly. However, because of the lack of anonymity this will bring about to its users, the company runs the danger of losing customers;

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Political tension

Google made the decision to abandon its intentions to deliver cloud services in China because of worries related to China's geopolitical landscape. If this happens in a lot of different countries, it can have an effect on the company's worldwide operations.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

WHAT MAKES GOOGLE'S E-BUSINESS MODEL UNIQUE?

SUSTAINABLE COMPETITIVE ADVANTAGE

Google's share of the market for search engines accounts for more than 60%. More than a billion user inquiries can be handled by the company's servers in a single day. The company has made significant financial efforts to guarantee that its data centers will continue to function normally. Using this strategy has allowed for the generation of advantages in terms of size and scope economies. This indicates that new search engines won't be able to compete successfully with the more well-established ones, since they won't have sufficient financial resources.

Google's research and development division is one of its strengths, which contributes to the company's competitive edge both in the market and overall. The fact that no other firm comes close to matching Google's degree of long-term competitive advantage demonstrates why this particular business model has been a resounding success.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

UNIQUE NETWORK PRESENCE

The Google search engine is available to anybody who wants to use it. Because Google's search engine is used by millions of people every day, the advertising business of the corporation has a significant advantage over its rivals. Additionally, by placing more of an emphasis on Android applications, Google will be able to appeal to a more diverse population of prospective ad buyers. Because of the increasing number of people who use mobile devices, the company has decided to put more of its focus on mobile advertising.

Google cannot function without the keyword searches submitted by users on the Internet. The company takes care to ensure that its systems are able to track each and every one of its activities. After that, the program will make use of the people's search phrases in order to generate traffic to the website of the advertiser.

REVENUE PREDICTABILITY

Google's self-serve platform was specifically built to function in the way that it does so that companies might get the most possible financial value from their efforts. However, given that Google has always been very secretive about this type of information, it is difficult for competitors to estimate how much money the company may make in the next few years.

In addition, keeping track of Google's ever-growing user base is a difficult task in and of itself. As more and more businesses move their operations online, it is reasonable to predict that Google's business model will continue to generate enormous profits for the company.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

CUSTOMER RETENTION STRATEGY

Keeping Google customers happy is relatively simple for Google. At the end of the day, the company's goal is to transform its customers into ardent supporters of the brand. This indicates that Google has successfully entrapped its consumers by providing them with a single platform from which they can access all of their various internet needs.

If we take the e-mail service provided by the corporation as an example, we discover that it currently has over 350 million active users. Google has created extra software such as platforms for sharing pictures, videos, and images; weblogs; and document storage in an effort to maintain its current customer base and attract new users. Users, both individuals, and businesses have commented on how user-friendly the web applications developed by Google are. This is a tactic for assuring long-term patronage of the business.

Nevertheless, it's important to note that Google primarily makes money from its advertising customers. It's the equivalent of relying on only one income stream. However, Google developed a system in which customers have no other option than to accept the price that is enforced on advertising without the ability to negotiate, since the service operates in a manner similar to a self-auction.

In addition, Google's profits are not heavily dependent on any one particular industry. It covers a lot of ground and is applicable to a lot of various fields. Because of this, the business will have a reduced risk of succumbing to the perils that are associated with placing an excessive amount of reliance on any one specific source of revenue.

The Google e-business model makes it easier for strategic relationships to be formed thanks to the members of the

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Google Network. These companies get access to millions of prospective clients as a result of being part of the Google ecosystem (AdSense). In exchange, the parent company is obligated to provide a portion of its revenues to each of its subsidiaries. Without the assistance of Google AdSense, these members would not be able to function. In addition, the company has strong control over its partners in the traffic acquisition process. These partners have been assigned the responsibility of driving online traffic to Google sites. Because of them, the company is in a position to bring in a sizable amount of revenue.

It's important to keep in mind, however, that Google has structured things in such a way that all of its business affiliates and partners benefit. The fact that the company is not dependent on them as a source of income is an additional benefit. To phrase it another way, Google is absolutely necessary for the continued existence of these partners.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

CONCLUSION

In light of all of this, it is reasonable to claim that Google's business model is founded on a variety of unique market niches and product offers. Due to the fact that it has ventured into and been successful in a broad variety of technical disciplines, Google is a serious competitor to practically every major technology business in the world.

Because of its well-known brand name, the company has been able to expand into markets that were previously unexplored. It is essential to keep in mind that even the revenue streams that have been discussed above are just a small part of the overall plan that the organization employs. Other Google businesses, such as Google AI, contribute a considerable amount to the search giant's total revenue.
