INTRODUCTION

Transitional business models are simply put business models that have temporary formats. They start one way but their companies' management knows it will end up another way. They can be phased in order to make the start process easier and create a more solid foundation for their main goal.

Many of the leading brands nowadays, such as Netflix, Apple, or Tesla, have passed through transitional strategies in order to adapt to their audience demands, before it is too late for changes.

This dynamic will persist for long yet, following technology improvements and business innovation, since transitional models provide profitable opportunities, in accordance with behavior, regulations, and technology evolutions.

But, don't get mistaken: implementing transitional business models doesn't involve predicting the future, but simply being flexible and open to welcome the changes the market unfolds. Let's check it out.

WHAT IS A TRANSITIONAL BUSINESS MODEL?

A transitional business model is a kind of phase the companies implement in order to enter a new market or niche (usually not big or scalable at first), to test traction, and to check if the idea is sustainable - and profitable.

This way, the business can secure capital while checking the venture, for market validation. According to the first results, the company can consolidate, iterate or abandon the idea, avoiding great losses. That's why the transitional business model is usually short-term, looking for maturation.

CHARACTERISTICS OF TRANSITIONAL BUSINESS MODELS

1. Transitional business models are designed according to the customer

Since transitional business models are kind of a response to market demands, they are built in accordance with what is best for the audience.

So, these businesses are easier to be employed and adapted by new entrants. For traditional players, on the other hand, that might be a challenge, as they need to change perspective and some already established status quo.

2. Transitional business models contest (and violate) regulations

Usually, in order to achieve the level of change and innovation the new business model demands, it will violate some current constraints, facing local regulators all over the world.

That's what happened to Uber, for example. The new company could not fit into any transportation system and process around the globe. In order to transform personal transportation, the company challenged laws and courts - but that was the only way it could get established, due to its

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

innovative characteristic.

3. Transitional business models reinforce brand before the market

Sometimes the brand's name is so strong that it can create a demand for a product or service before the market or audience asks for that.

A good example of that is Amazon's drones. Amazon is still experimenting with drone delivery services, but we already associate the service to the brand - even before drone applicability proliferates.

4. Transitional business models are easily adaptable

Nevertheless, the most important feature of a transitional business model is the fact that it exists to adapt to customer demands. It is a strategy to predict what the market wishes, before it actually knows the wish.

As said above, of course, no one can guess the future, indeed. But some general idea - not details - can be anticipated, by observing behavior changes and technology innovations.

It is even fair to say that all businesses are transitional, somewhen, somehow. Any company must concentrate on optimizing the production, predicting desires, avoiding risks, discovering potentials and advantages. And that can only be done by experimentation.

COMPANY CASES

TESLA

Tesla, Inc. was founded in 2003, originally as Tesla Motors - since the company initially produced only automobiles. Fourteen years later, the name would change to incorporate supply lifestyle products.

Tesla's first car was launched in 2008 - the Tesla Roadster. It was a high-performance electric sports car, targeting a public with high purchasing power. Thus, instead of launching a cheaper first car, to gain in quantity, the Roadster was, indeed, a luxury article.

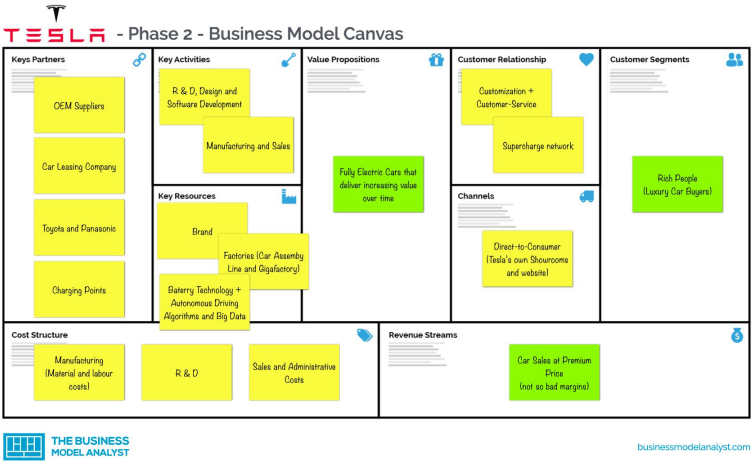

Musk, the company's CEO, explained that with all the technology they intended to put in the car, it would be impossible for it to reach the market at a low price. For this

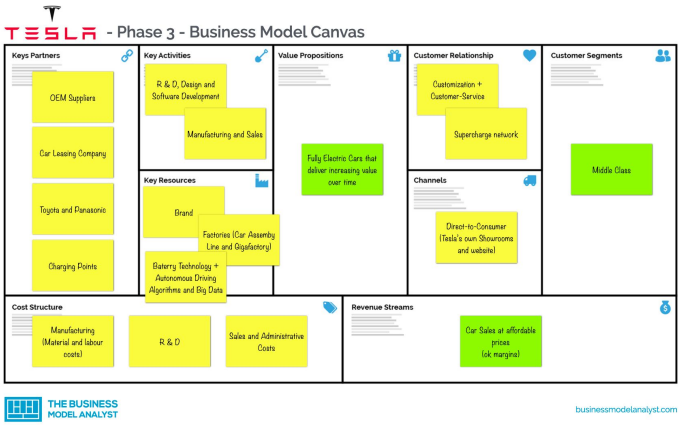

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

very reason, they chose to launch a more compelling product.

However, in the following years, with the revenue from the sales of the high-priced cars, Tesla invested heavily in marketing, research, and development, prioritizing studies in safe, autopilot, green energy, and charging cars.

This way, the company would be able to produce and commercialize a more affordable electric car, achieving economies of scale, in order to reach the middle class.

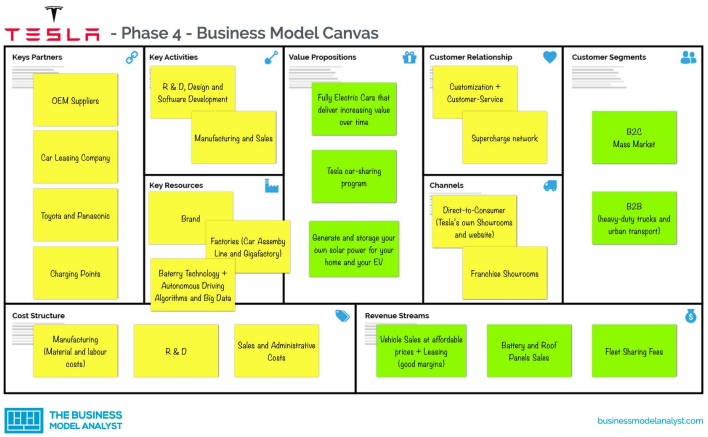

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Nowadays, Tesla has three main revenue streams:

1. **Automotive:** there are three main products. Model 3, for mass adoption, a mid-sized sedan with an accessible price for mass-market. Model Y, a compact sport utility vehicle (“SUV”) for up to seven adults. And Model S/Model X, full-sized sedans with more advanced features.

2. **Automotive leasing:** Tesla offers financial services, such as loans and financing. For some of the funding programs, they offer a resale value guarantee clamp. This protects against possible losses when a customer wants to resell the vehicle.

3. **Energy generation and storage:** part of Tesla's mission is “to accelerate the advent of sustainable transport”. To that end, the company sells transmission systems and components to other manufacturers. It also introduced a line of household batteries, which serve as energy storage systems. To increase participation in the residential segment Tesla merged with SolarCity (a photovoltaic panel company that also has Elon Musk as a partner).

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Currently, in order to meet its marketing strategy, Tesla uses direct sales - unlike other car manufacturers that sell through a franchise model. The brand has created an international network of stores to display its cars (mainly in prominent urban centers worldwide) and it also sells directly via ecommerce.

The objective is to gain an advantage in the speed of product development, create a better customer shopping experience and increase its margins. The results have put Tesla among the most valuable car manufacturers in the world.

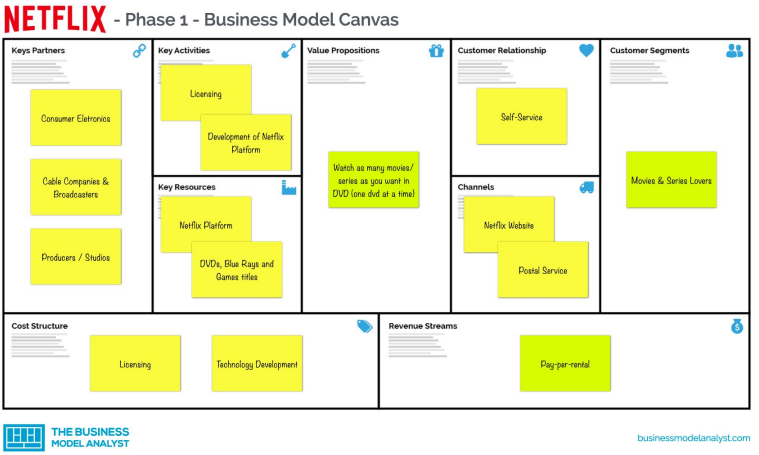

You can read more about it in Tesla Master Plan and Master Plan Part Deux written by Elon Musk.

NETFLIX

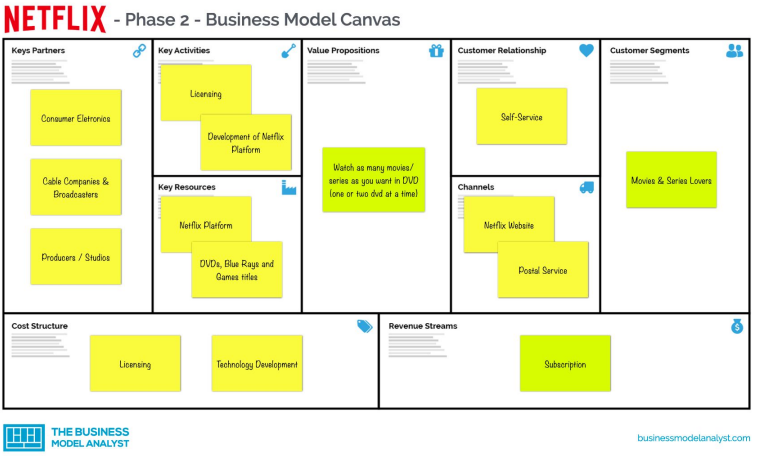

Netflix is nowadays the largest streaming provider of entertainment content on the planet. Subscribers to the platform have a huge catalog of films, series, documentaries, and television shows at their disposal, to be watched anytime and through any device connected to the internet.

But Netflix did not start directly with this business model. On the contrary, its first business model, back in 1998, was based on a DVD rental system by mail to the entire United States.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

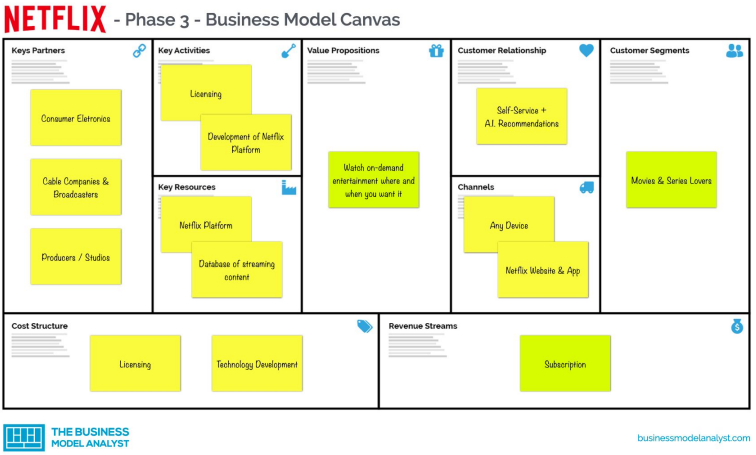

Its initial business was based on sending physical copies of films, shows, video games, and other media through the American standard mailing system, in a pay-for-use model. And, the next year, it changed to a subscription model.

Over the following decade, Netflix watched the DVD rental market begin to decline and had to adapt its business model. Then, it stopped sending physical copies and made a catalog of titles available online, to be consumed by the public, at any

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

time, in their home.

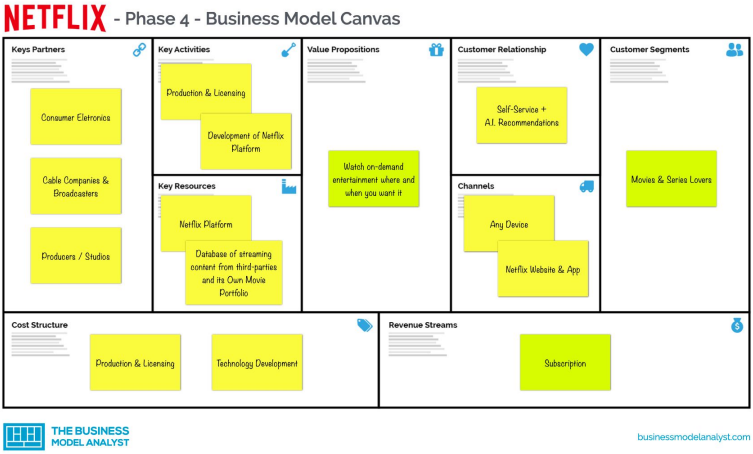

Currently, Netflix's business model is scalable and subscription-based. It is a streaming platform, which offers on-demand video. The brand makes money with three plans, in fixed fees, which vary by country.

By transforming its business model, Netflix has also transformed the way people consume video entertainment. Today the streaming service is a strong reality that has even attracted several competitors, with names such as Amazon Prime.

To keep its competitive advantage over its competitors, Netflix started to create its own film productions, called Netflix Originals.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Nevertheless, Netflix remains the absolute leader in the segment, with over 180 million subscribers worldwide.

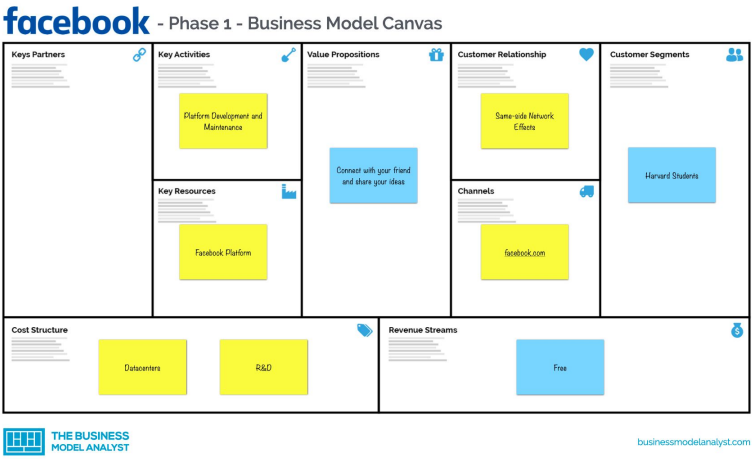

FACEBOOK

With over 15 years in the market, Facebook now has more than 2bi users all over the world. It keeps also growing due to the acquisitions the company has been taking, of brands – and competitors – as Instagram and WhatsApp.

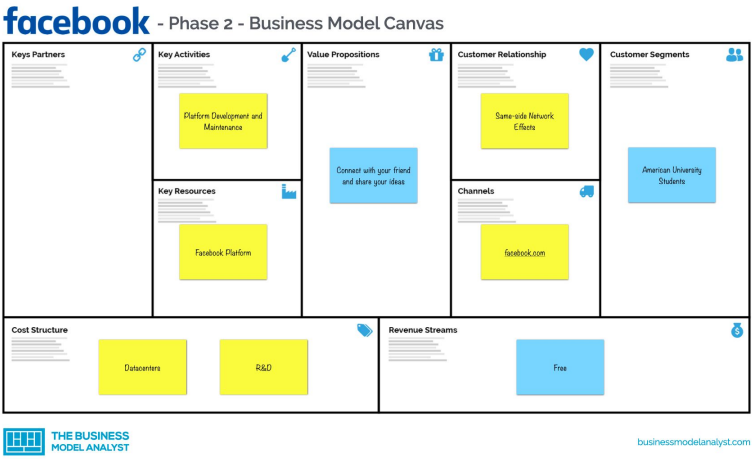

But when Mark Zuckerberg, the founder, created Facebook, he couldn't imagine the potential of the company he had in its hands (it wasn't even a company, back in the early days). Zuckerberg was a psychology student, at Harvard University, and also a programmer.

Before Facebook, he had developed some social-networking websites for fellow students, such as Facemash, where students could rate the others' attractiveness. "The Facebook" - that was the first name of this social network - was launched in 2004.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

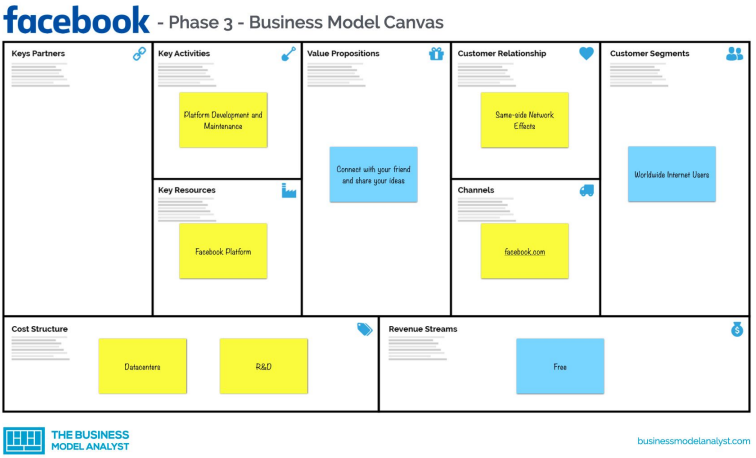

In just the first 24 hours, more than 1,200 students from Harvard would sign up. And, in the first month, half of the Harvard population was part of the network. After that, the fad started to spread: first over other Boston universities, then the Ivy League, and so all American universities.

One year later, in 2005, the social network would be named only “Facebook”, and began to gather profiles from universities outside the USA. In 2006, anyone with an e-mail

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

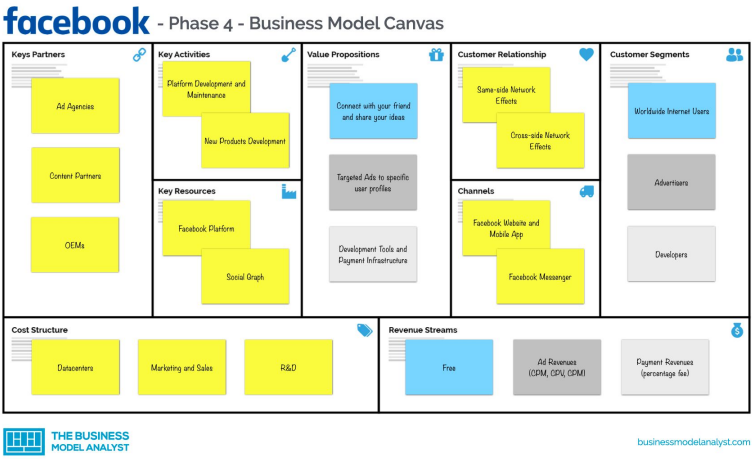

could be part of the network. The rest is history.

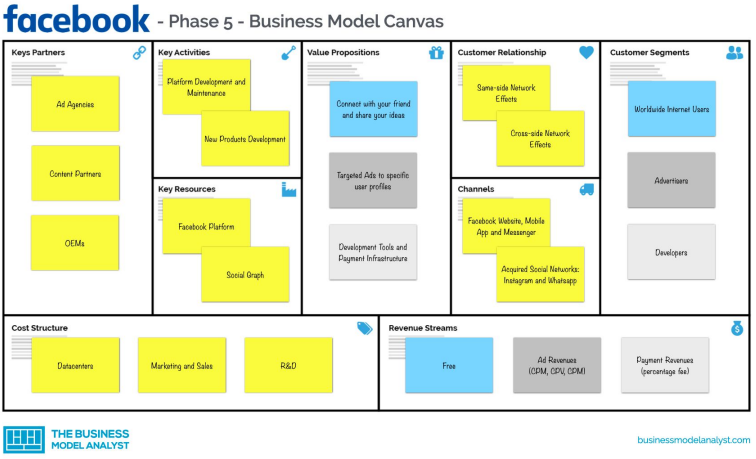

According to Zuckerberg, as he was developing Facebook, he wouldn't have the ambition to build a worldwide enterprise. Unlike that, he would only realize that one "could find almost anything on the internet—music, books, information—except the thing that matters most: people".

Nowadays, the greatest revenue stream of Facebook is the targeted advertisement, due to the benefit that the platform offers, of allowing advertisers to reach their target audience, through information the network collects from its users.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

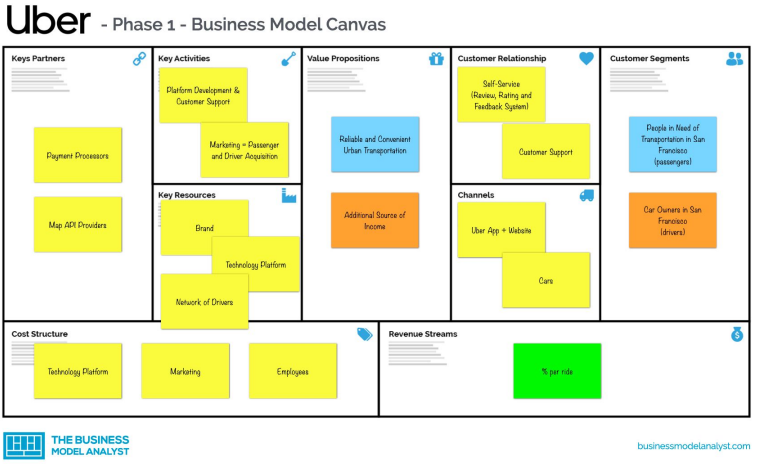

To keep growing its ads revenue Facebook started to expand its reach by acquiring new social networks.

UBER

Uber is a technological platform that has revolutionized urban transportation. The app connects drivers to users who need a ride, using a smartphone as a tool.

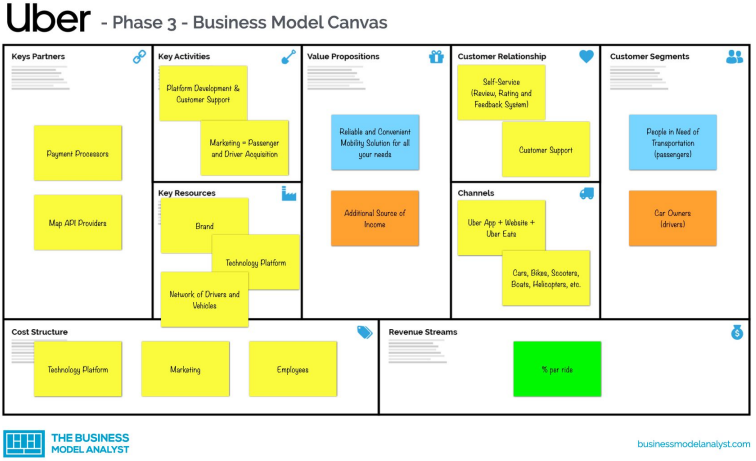

Currently, with kind of a decade of existence, Uber operates in more than 900 cities worldwide and has a valuation of more than $ 70 billion.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

According to Dara Khosrowshahi, CEO of Uber, “Uber accounts for less than 1% of all miles driven globally.”

However, the company’s vision is much wider than simply attracting new users. Uber’s ultimate vision is to become a top urban mobility platform, changing from just a car-sharing system to a greater company, able to make the user get from A to B in the most affordable, dependable, and convenient way.

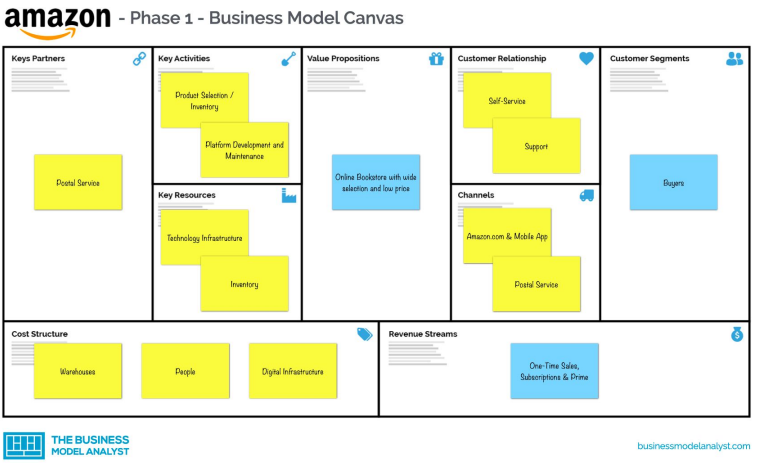

That’s precisely why Uber started with cars and is already operating with bikes, boats, and even helicopters. The end goal is to allow people to live without a personal car, thus reducing congestion and the need for parking spaces, and so providing a higher quality urban life.

AMAZON

Back in 1994, Jeff Bezos chose the name Amazon for an online company he was going to build. Then, he made research that showed the best product to start this venture was book sales. So, Amazon began as an online bookstore, selling items from its own inventory only.

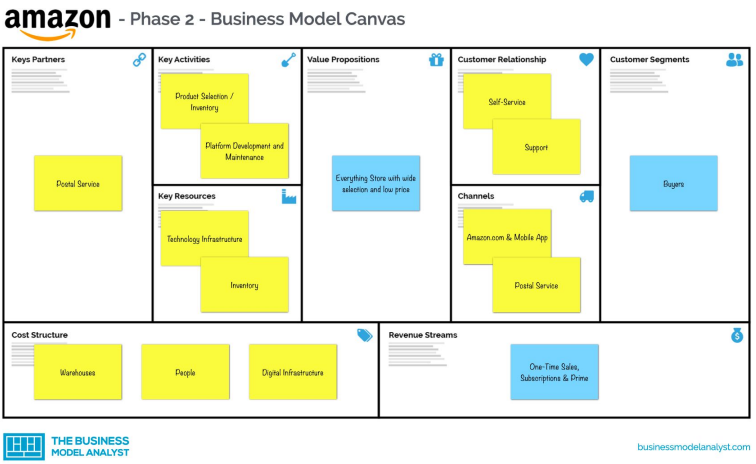

But books were simply a logical choice because they were a kind of safe bet for a still-emerging market: the internet. For Bezos, since the beginning, Amazon has been a technology company, aiming to simplify online transactions - not a simple bookseller on the web.

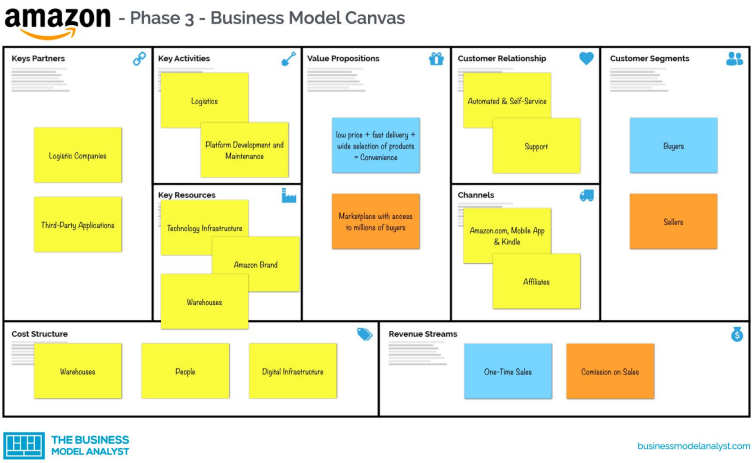

Despite all the criticism and skepticism, the company faced at first, after the first year of operation, one million customers had already signed in to the Amazon site.

Bezos' strategy proved to work out, and the e-commerce platform soon began to sell much more than only books, starting with music and video in 1998, followed by electronics, software, games, toys, and household items the next year.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

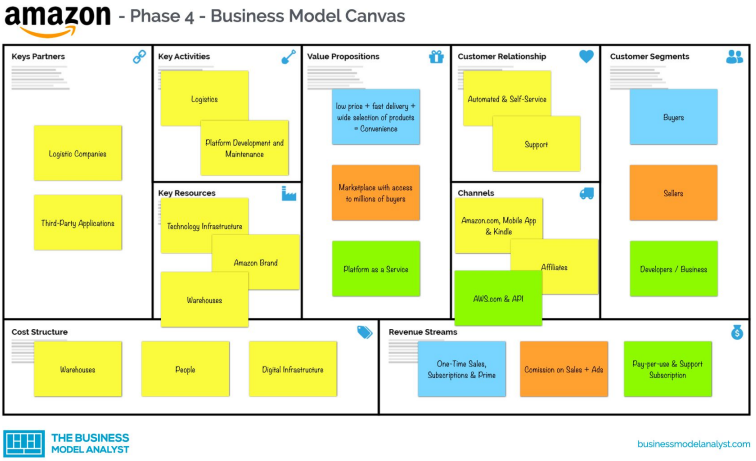

Not long after that, Amazon became a marketplace, opening its platform to external vendors. This move boosted the amount of available products and its image as the “everything store”.

Also, to confirm that Amazon was, indeed, a technology company, in 2002, it launched AWS (Amazon Web Services), by offering data about internet traffic and other statistics. 18 Currently, the platform provides its Elastic Compute Cloud

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

and data storage over the internet.

In short, Amazon went from a bookstore to an “everything store” and then to an e-commerce giant. For the buyer, it is comfortable to know that Amazon will always bring a reasonable and competitive price in all fields and products. And for sellers, it’s convenient to be sure they can easily display their products on the website and make sales overall continents on Earth.

Nowadays, there are some different operations this big corporate umbrella:

- **Amazon Marketplace:** the company's first revenue stream, **Amazon.com:** accounts for more than 50% of the income. Basically, Amazon asks for a fee from its sellers to promote and advertise their products.

- **Amazon Prime:** it is Amazon's subscription business model and has been vital to the brand's growth. In exchange for a monthly fee, subscribers have access to the platform's video and music streaming catalog, free 19 two-day shipping, unlimited photo storage, etc.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

Prime currently has more than 150 million members.

- **Amazon Web Services:** its low-cost complete IT structure platform, whose services are contracted by companies, organizations, and institutions around the world.

- **Amazon Kindle:** it is Amazon's e-reading service. Users can buy, browse and download books, magazines, and newspapers, available at Kindle Store. Amazon doesn't make much money from Kindle itself, but by attracting traffic to the Prime membership plan. Besides, the platform allows independent authors to publish their info-products and e-books, charging something between 30-70% of royalty fees from the sales.

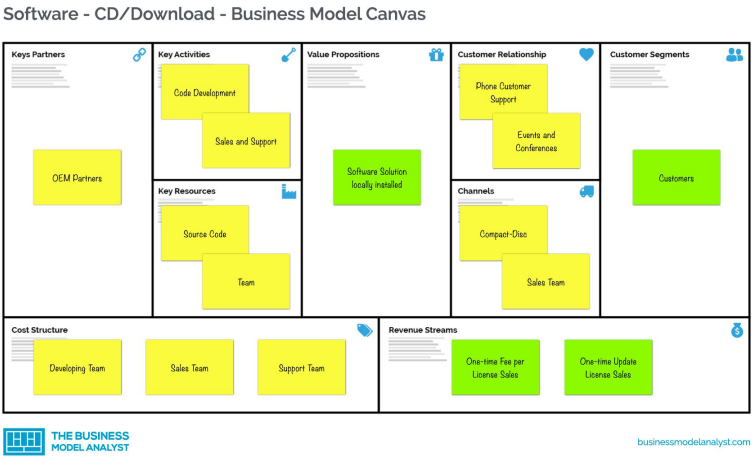

- **Amazon Patents:** the company has more than 1,000 patents, several of which are licensed by other companies.

- **Amazon Advertising:** Amazon Ad platform offers sponsored ads and video. It is a very efficient marketing channel, since the audience that accesses the platform is already there with the intention of buying.

INDUSTRY CASE: SOFTWARE

When we thought of software industries, a few years ago, we thought about companies that used to sell their solutions as individual products: you would buy a CD or download the program online in exchange for one only payment. When the time comes to update or upgrade the software, you would need to buy a whole new version of it.

However, over the last decade, the software-as-a-service industry has grown exponentially, especially linked to the power of cloud computing. Today, the SaaS business model takes up a fair share of B2B tech offerings.

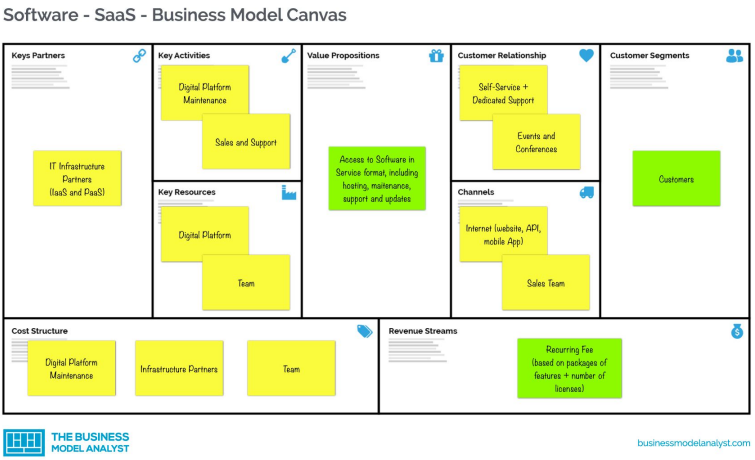

SaaS is when software is made available to customers on a subscription basis. Thus, the software is cloud-based,

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

centrally hosted and maintained, and only licensed to customers, for as long as they maintain their subscription.

In this way, all responsibility for the software rests with the company - server, security, maintenance, database, etc. - and the user does not need to worry about installations and updates, for example. In general, it can access the system via a web browser, mobile app, or downloadable desktop software.

On the other side, the company maintains recurring revenue, as long as its customers keep using the software. And they can offer the same large-scale service on the market.

It is fair to say that most SaaS companies have been SaaSnative. But there are thousands of brands that have started out as traditional vendors and had to change to SaaS, in order to satisfy the current software buyers.

To minimize the impacts, software companies in transition must establish a strategy for the shift and organize the whole business model transformation (not simply a revenue model change). Unlike what some people may imagine, this

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

transition will usually take long, as to consider customer needs and market situations.

Some companies are opting to no longer sell perpetual licenses. But there are others that offer SaaS and perpetual licenses at the same time. This usually happens when the brand already has an engaged audience satisfied with the regular transactions.

For the companies that choose to make the full transition, it is crucial to analyze the whole business model alteration, from sales and marketing to operational requirements and finances.

However, the advantages of SaaS companies are basically two:
1) if your product is essential to your client's business or lifestyle, they will more likely remain loyal. And it is precisely this loyalty that makes SaaS a profitable business model, and **2)** as they remain loyal, they provide recurring payment. In practice, your customers are just “renting” your software. So, if they want to continue using, they will have to keep paying. The company has a recurring revenue that, once it exceeds the amount invested, turns into profit.

On the other hand, the greatest challenge for SaaS businesses is that to put your product on the market, you need a heavy initial investment (research, development, programming, design, security, storage, resources, etc.). And you will have this investment returned in small installments and divided among several customers. It is different from when selling "whole" software, in one go.

The truth is, what was once a trend is now the reality. The market will end up asking for this transition, from the whole software industry, sooner or later. It is time to define strategy and compete in this SaaS-driven environment.

HOW TO IMPLEMENT

As mentioned above, virtually every business will face a business model transition at some point. The shift can be challenging, but there are some guidelines you may follow in order to optimize the process:

Start with a smaller customer segment
Most of the case studies in this guide have started targetting smaller segments and eventually grew its target audience to bigger markets.

You may call this the minimum viable segment. It will defintely makes things less complicated at the beggining. It's easier to understand your customers, its easier to adjust your product/ service, it allows you prepare the base to scale later on.

Facebook started targeting harvard student universities, Tesla started targeting the ultra-rich, Amazon focused on selling books, etc.

Mix and balance old and new teams
When you go into the transition, it is essential for your company to merge the team you already have, with all their know-how and experience, with some new members, who will bring the knowledge over the innovative processes and technology.

Usually, it is not a good idea to change the whole team, just hiring new staff to substitute the people that had worked with you along the way. But it is important to bring some fresh ideas, especially from experts in the area you are aiming to

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

incorporate into the business.

So, take good care to balance both teams and their roles in the operations. The strongest your team is, the bigger the chances of success.

Allow re-invention
Still regarding teams, sometimes, when you make the shift, you find out that new positions and new functions might be created inside the company. You don't always have to bring these talents from outside.

Many times, people that have been with you for a long may be able to develop the abilities and skills you need for the transition. It is imperative, in this case, that you encourage and validate these fellows' re-invention.

They can acquire knowledge and educate themselves about the new challenge. They are more likely to get motivated and feel embraced by the company, adding value to the venture.

On the other hand, sometimes, there are some employees that will see the new ideas, processes, and even products as threats. In some cases, they may sabotage the transitions or become a toxic influence for their peers. If these people demonstrate they won't be able (or even willing) to adapt, unfortunately, you have no other choice but to take them out of the way.

Communicate the team
First of all, change is scary. People get more comfortable when they know that their feelings are shared and that they are aware of fears and risks. That's why it is important, to be honest about the whole situation and keep the employees informed about everything from the beginning.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

In order to do that, it is necessary that you answer all the basic questions your team will come up with. Anticipate yourself, by responding:

- Why is this transition important?
- Why doesn't the old model work anymore?
- What has changed in the world and in the market that requires this kind of transformation?
- What are the implications and consequences for customers, employees, suppliers, and any other people involved in the operation?
- Why and how will this shift make our company stronger and more competitive?

And don't forget: you, as a leader, will have to persevere, by repeating the whys, hows, and whats, as many times as needed, in order to ensure a sound and successful transition.

Never forget the customer

It is pretty common that, since you are focusing on implementing the new business model inside the company, you "forget" to show the changes to your customers, and bring them closer to the shift.

But that can be dangerous to your business, as the customers may not understand what is going on. Sometimes, they think that you simply changed the product and, so, the value proposition you used to offer is now different. In other cases, the audience feels you lost touch with them.

Anyhow, as your business will always depend on your customer's approval, it is essential you bring them together with you, communicating, explaining, making them understand and feel welcome, being part of the whole

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

transition process.

Work on communicating the benefits they can expect from that. This clear communication can even become an opportunity to improve your reputation among your audience.

Take your time

The business model transition does not have to be taken in a hurry. You don't have to rush to exchange the products and services, hold the production, substitute suppliers and hire as many talents as possible. That is not going to work out.

The transition may be a huge process and that requires time and planning. So, bring your staff on board and, with their help and experience, plan carefully all the steps the transition will have to take. Tray to predict the threats. Calculate the investments. Evaluate suppliers.

Ultimately try to "put on paper" everything you and your team can anticipate before you start to practice what you have defined together.

Moreover, business model transitions can be difficult if your company relies on a revenue stream that is going to phase out. Even if the revenue stream that will replace it is more profitable or successful, because, until it gains traction, it can be tricky for cash flow in the short term.

A gradual change, on the other hand, can give the business the time it needs to learn new processes, face challenges, and correct mistakes.

This PDF File was purchased by Muchamad - kurniatisri952@gmail.com
Copyright The Business Model Analyst - https://businessmodelanalyst.com/ - Distribution prohibited

CONCLUSION

Every business will eventually transition its business model through time. But the very successful businesses know how their business models will start and what they wish to become over time, planning even the in-between phases of it. This is a fundamental piece of the strategy map of worlds segment leaders.
